

Hedge Overlay Recommendation

model_v4 — "up-shock + vol-surge" 1-day semis hedge

Standalone overlay (src/hedge_overlay.py); the model is NOT modified.

THE RULE (decide at close T, hold T+1 only, exit next close)

FIRE if: QQQ 1-day return $\geq +2\%$ AND $z(\text{SPY 5d realized vol, 63d}) \geq 1.0$
THEN buy: SOXS (long -3x inverse-semis ETF -- no shorting), sized INVERSE-VOL
to ~14% of INVESTED capital (positions, ex-cash); hedge \$-vol
= 50% of book \$-vol, scales with invested size & vol $\Rightarrow$ ~\$14k per \$100k invested.

WHAT IT TARGETS

- Sharp up-days that occur while volatility is already elevated -- a combination that tends to mean-revert (pull back) the next session.
- No single factor works alone (a QQQ up-day alone BOUNCES); the edge is the INTERACTION of up-shock x elevated vol.
- Best supporting signal (sensitivity): 5-day realized-vol z-score. Relative vol beats absolute level / surge-ratio; the 5d window beats 1d and 20d.

QUANTIFIED VALUE (\$100k book, SOXS inverse-vol ~14% avg, 68 fires)

1-DAY hold (THE RULE): net \$+26,846 [wins \$+47,962 / losses \$-21,116, 57% win]
if held 5D: \$+13,032 if held 20D: \$-117,571 $\rightarrow$ the 1-day exit IS the edge
best saves: 2020-03-13 \$+7,369 (book -9.0%) - 2026-06-16 \$+2,034 (book -3.8%)

RISK-ADJUSTED (SOXS inverse-vol)

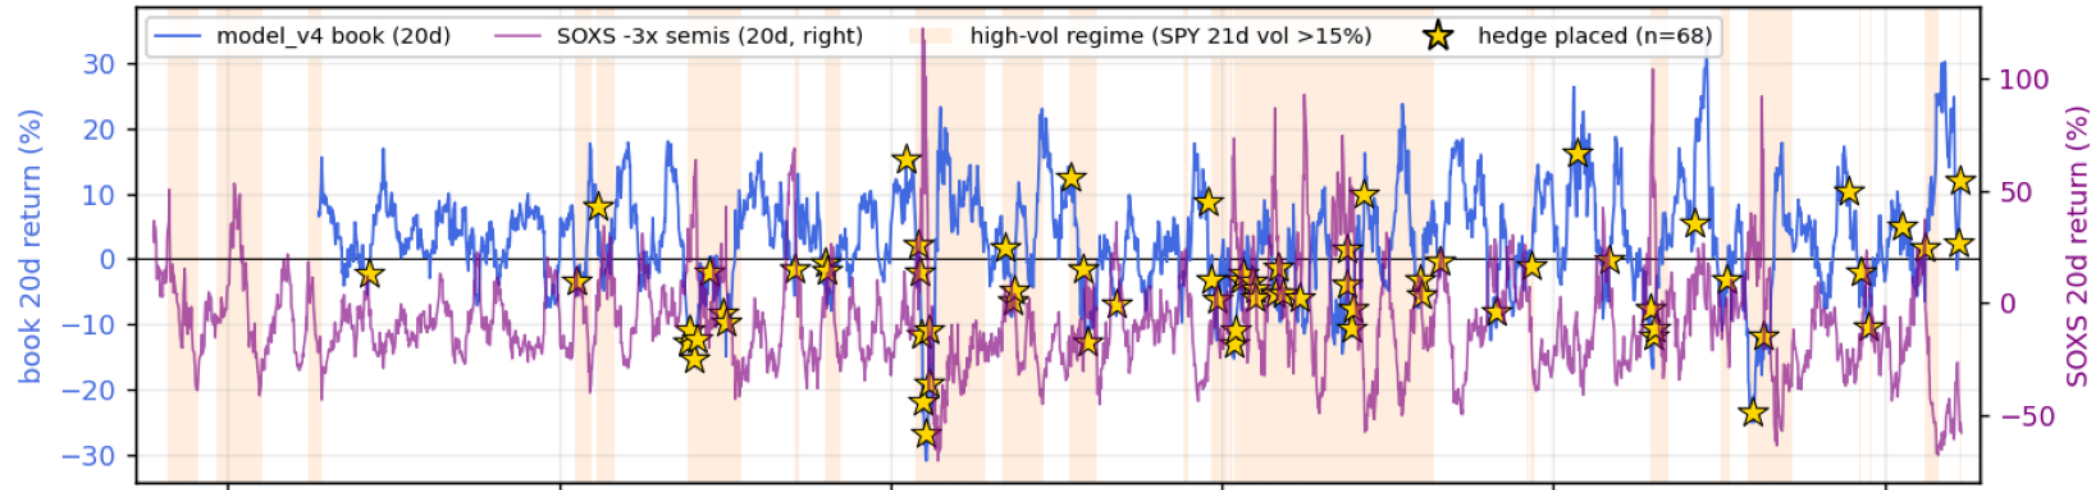

FULL: dSharpe +0.11 sleeve PnL +26.8% worst on-day -9.0% $\rightarrow$ -4.2%
OOS (≥ 2024): dSharpe +0.08 sleeve +5.2%
Walk-forward: 7/10 active years dSharpe > 0 ; gains concentrated in vol-spike years

CAVEATS

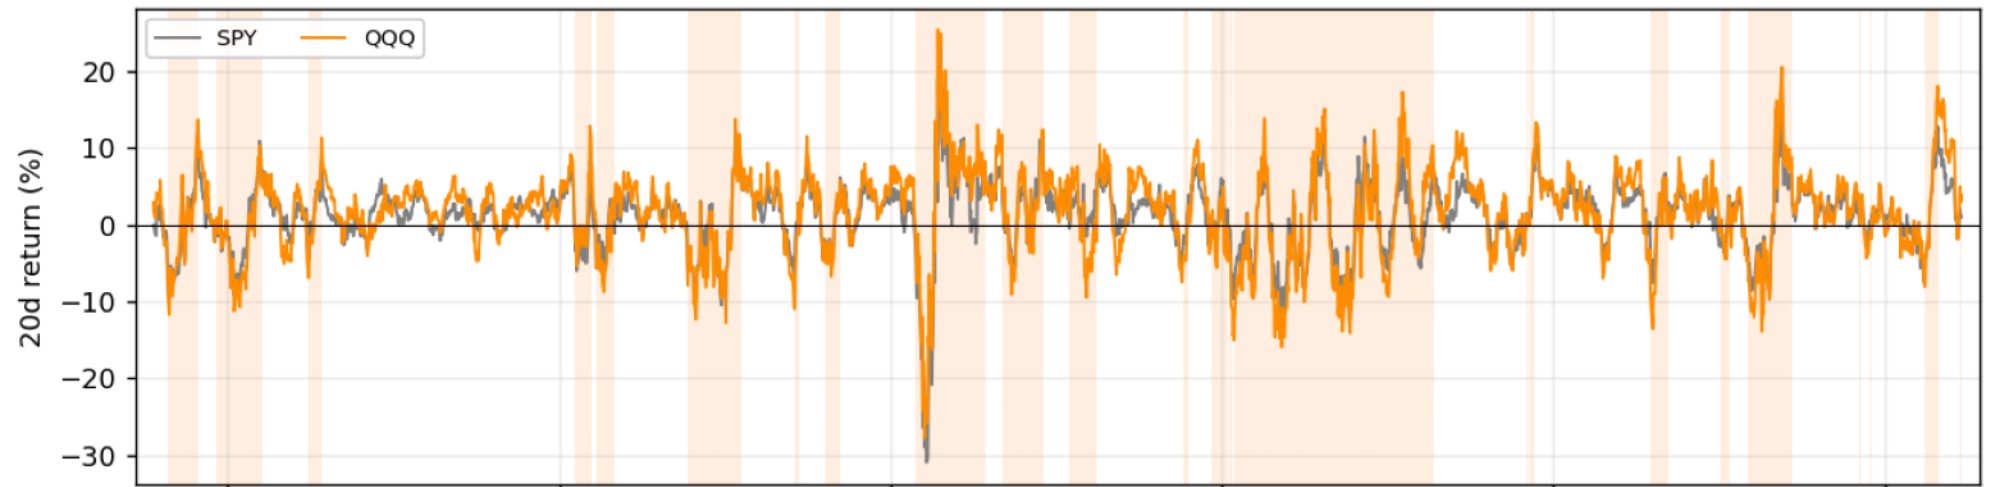

- A Sharpe-adder + single-day-blow softener, NOT an all-time-max-drawdown reducer.
- Edge concentrates in vol spikes; marginal in calm years; slightly -ve in 2022 bear.
- Costs use a flat 10bp; SOXS real spread / expense / 1-day -3x decay may be higher.
- Paper / recommendation only. Re-validate after any model or universe change.

SOXS hedge, inverse-vol sized (~14% avg notional) on \$100k book – PnL by hold horizon (n=68 fires)
1-DAY (the rule): net \$+26,846 [wins \$+47,962 / losses \$-21,116, 57% win]
5-DAY: \$+13,032 20-DAY: \$-117,571 -> strict 1-day exit is what saves \$
best 1D saves: 2020-03-13 \$+7,369 (book -9.0%) - 2026-06-16 \$+2,034 (book -3.8%)

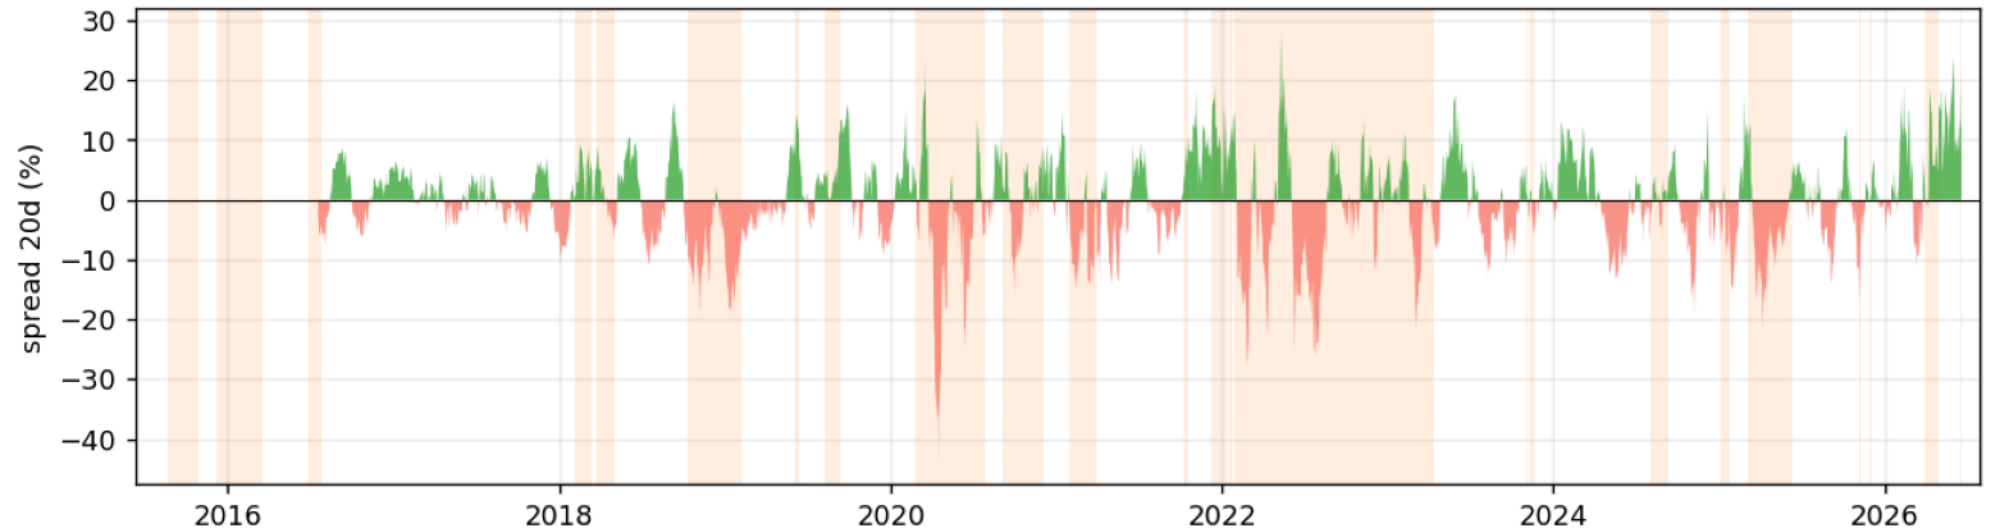

model_v4 portfolio vs SOXS hedge — ★ = hedge placed (up-shock + vol-surge)

SPY / QQQ — trailing 20-day return

Top10–Bottom10 spread (20d, fill)

Backtest — windows & yearly walk-forward

Default: SOXS (long -3x) sized inverse-vol (hedge=50%% of book risk), trigger $qqq_1d \geq 2\%$ & $z(spy_vol_5d) \geq 1$. dSh = hedged-minus-book Sharpe; dDD = max-DD change (+ = better).

EXAMPLE CASE STUDY - 2026-06-16

Trigger @ 2026-06-15 close: QQQ +3.1% up-shock, SPY 5d-vol $z = +1.46$ (elevated) -> RULE FIRES

Next day 2026-06-16: book -3.80% (leaders-led: top10 -5.7%, SMH -4.8%, QQQ -1.9%, SPY -0.6%; spread -4.0%)

Hedge result: SOXS (inv-vol, 12% of invested = ~\$12k) -> +2.03% (\$+2,034 on \$100k) -> the -3.8% book day softened to ~ -1.8%

Appendix A

Correlation & Gap Analysis (full history 2016-2026)

(source: corr_tails_by_horizon.pdf)

Trailing-factor avg, correlation & UP-DN gap, by forward book-move segment

UP/DN cells: top = mean of trailing measure in-segment; bottom = its corr with book fwd return (purple shade = |corr|).

D = UP avg - DN avg (pp for %-measures; raw for scores). D cells shaded amber by |D| within each column (deepest = biggest gap). See next page for sorted ranking.

Read across a horizon group: UP, DN, then gap D. Positive D = factor ran higher before up-moves. In-segment corr is range-compressed by tail conditioning.

Biggest UP-DN trailing-factor gaps, sorted by |D| within each horizon

D = UP avg - DN avg (pp for %-measures, raw for scores). Each column sorted by absolute gap, largest first. Scores sit on a 0-1 scale, so their raw gaps look tiny next to % returns.

Trailing -> Forward correlation call-outs (|r| >= 0.5)

Strong = |r| >= 0.70 | Moderate = 0.50 <= |r| < 0.70. Cells ranked by |r|.

avg() = mean of that factor across the days passing the panel filter.

Small-n panels (n < ~40) are noise-dominated; weight accordingly.

Forward 1-Day portfolio return (filtered by book_fwd_1d)

Appendix B

Correlation & Gap Analysis (since-COVID, vol-normalized)

(source: corr_tails_by_horizon_since_covid_volz.pdf)

D = UP minus DN. Returns/vol abs in %; scores raw.

JUN-15 z shows how far that factor sat above/below its recent norm at that close; compare its sign/size to the UP vs DN segment z to read the regime.

Biggest UP-DN gaps, sorted by |z-gap| within each horizon

SINCE COVID (2020-04-01 to 2026-06-18, n=1562) | z = rolling z (value-recent mean)/recent std, L=63d | JUN-15 = 2026-06-15 close

Sorted by absolute normalized gap. Dz colored; (abs gap | zUP/zDN) grey. JUN15 = factor z at 2026-06-15.
