

Trailing-factor avg, correlation & UP-DN gap, by forward book-move segment

UP/DN cells: top = mean of trailing measure in-segment; bottom = its corr with book fwd return (purple shade = |corr|).

D = UP avg - DN avg (pp for %-measures; raw for scores). D cells shaded amber by |D| within each column (deepest = biggest gap). See next page for sorted ranking.

Read across a horizon group: UP, DN, then gap D. Positive D = factor ran higher before up-moves. In-segment corr is range-compressed by tail conditioning.

Biggest UP-DN trailing-factor gaps, sorted by |D| within each horizon

D = UP avg - DN avg (pp for %-measures, raw for scores). Each column sorted by absolute gap, largest first. Scores sit on a 0-1 scale, so their raw gaps look tiny next to % returns.

Trailing -> Forward correlation call-outs (|r| >= 0.5)

Strong = |r| >= 0.70 | Moderate = 0.50 <= |r| < 0.70. Cells ranked by |r|.

avg() = mean of that factor across the days passing the panel filter.

Small-n panels (n < ~40) are noise-dominated; weight accordingly.
