All books on model_v4, marked to the official close (the 1-day overlay hedge is sold at the close). Day = portfolio return vs the prior close (port/SPY/QQQ); session/held returns are hedge-inclusive. Since incep = since each book's inception (the scenario from its backtest start; accounts from their funding date— so it differs by row). Held DW = dollar-weighted held-book return. Hedge P&L = realized P&L of the overlay hedge exit. Paper-trading research only— not advice.
