

Performance Snapshot — model_v4 + Alpaca accounts 2026-06-23

1D return & 1D P&L (vs 2026-06-22) · SPY / QQQ context · current marks

MODEL_V4 1D RETURN

-3.57%

MODEL_V4 1D P&L

-\$6,293

ACCOUNTS EQUITY (Σ)

\$286,450

ACCOUNTS 1D P&L (Σ)

-\$12,633

Simulated reference — model_v4 scenario (backtest)

Book	Mkt Value	Cash	1D Return	1D P&L	SPY	QQQ	#Pos
model_v4 · scenario	\$153,138	\$16,729	-3.57%	-\$6,293	-1.35%	-3.27%	10

Live Alpaca paper accounts — three ways to implement model_v4

Each account is a different way to put model_v4 to work at any given date: buy the top-10 CURRENT ranks equally (Top 10 Seed), buy the model's CURRENT holdings (Existing Model Seed), or ramp up by only buying names scoring > 0.9 each day (Ramp Up).

Book	Mkt Value	Cash	1D Return	1D P&L	SPY	QQQ	#Pos
Top 10 Seed	\$85,904	\$8,309	-5.87%	-\$5,874	-1.35%	-3.27%	11
Existing Model Seed	\$93,685	\$1,519	-3.84%	-\$3,800	-1.35%	-3.27%	10
Ramp Up	\$30,280	\$66,754	-2.96%	-\$2,959	-1.35%	-3.27%	4

Definitions

- model_v4 · scenario — the model_v4 momentum strategy backtest (83-name semis/AI/tech universe, Barroso vol-targeting) from its backtest start. Simulated, not a broker account.
- Top 10 Seed — Alpaca paper account holding the 10 highest CURRENT composite-score names, ~8.5% each, rebalanced toward that set.
- Existing Model Seed — Alpaca paper account that EQUAL-WEIGHTS the names the live model_v4 book (primary) currently holds.
- Ramp Up — Alpaca paper account holding every name whose current composite score ≥ 0.9 at current ranks, 8.5% each (a score-gate ramp-up).

1D Return / SPY / QQQ are measured over the 1D window (since 2026-06-22) — for 1D, since the prior trading close. 1D P&L = the dollar change over that window (equity — equity at the window start). Broker accounts use live Alpaca equity vs the prior close; the model_v4 scenario uses its simulated equity. Mkt Value = market value of current holdings; Cash = cash balance (total equity = Mkt Value + Cash). Paper-trading research only — not advice.
